## Package 'PredictiveDGP'

July 27, 2021

Title Predictive DGPs exhibiting various distributions

Version 1.0.0

**Description** This package generates data vectors Y and X using a simple predictive regression model with no intercept and a single regressor. The regressor follows an AR(1) process with no trend and no intercept. A framework of similar nature was initially studied by Mankiw and Shapiro (1986). For each R function, the predictor's errors are distributed according to a standard normal distribution, whereas the disturbances of the predictive regression are changed according to the function of choice. The degrees of contemporaneous correlaion and persistency of the regressors are nominated the investigator.

**BIVDGP** 

Normal errors with break in variance

#### **Description**

The processes y and x are generated by a predictive regression of the form  $y_t = \beta + x_{t-1} + \varepsilon_t$  for  $t = 1, \cdots, T$ , in which the regressors follow an AR(1) process - i.e.  $x_t = \theta x_{t-1} + u_t$ . The predictor's errors are distributed according to  $u_t \sim N(0,1)$ , whereas the disturbances of the predictive regression,  $\varepsilon_t$ , are distributed  $\varepsilon_t \sim N(0,1)$  for  $t \neq T/2$  and  $\varepsilon_t \sim 1000N(0,1)$  for t = T/2 respectively. An example of standard Normal disturbances with break in variance can be found in Dufour and Taamouti (2010). The initial value of the process x is generated by  $x_0 = \frac{w_0}{\sqrt{1-\theta^2}}$ , where  $w_t \sim N(0,1)$ . Finally, the contemporaneous correlation between the disturbances  $\varepsilon_t$  and  $u_t$  is captured by  $\rho \varepsilon_t + w_t \sqrt{1-\rho^2}$ .

#### Usage

```
BIVDGP(n, beta, theta, rho)
```

#### Arguments

n the number of observations

beta the regressor coefficient of the predictive regression theta the autocorrelation coefficient of the predictor rho the contemporaneous correlation coefficient

#### References

Dufour J, Taamouti A (2010). "Exact optimal inference in regression models under heteroskedasticity and non-normality of unknown form." *Computational Statistics* & *Data Analysis*, **54**(11), 2532–2553.

#### **Examples**

```
BIVDGP(n=50, beta=0.5, theta=0.999, rho=0.9)
```

CauchyDGP

Cauchy errors

#### **Description**

The processes y and x are generated by a predictive regression of the form  $y_t = \beta + x_{t-1} + \varepsilon_t$  for  $t = 1, \cdots, T$ , in which the regressors follow an AR(1) process - i.e.  $x_t = \theta x_{t-1} + u_t$ . The predictor's errors are distributed according to  $u_t \sim N(0,1)$ , whereas the disturbances of the predictive regression,  $\varepsilon_t$ , are distributed  $\varepsilon_t \sim Cauchy$ . An example of a predictive regression DGP with Cauchy perturbations can be found in Campbell and Dufour (1995). The initial value of the process x is generated by  $x_0 = \frac{w_0}{\sqrt{1-\theta^2}}$ , where  $w_t \sim N(0,1)$ . Finally, the contemporaneous correlation between the disturbances  $\varepsilon_t$  and  $u_t$  is captured by  $\rho \varepsilon_t + w_t \sqrt{1-\rho^2}$ .

ExpVarDGP 3

#### Usage

```
CauchyDGP(n, beta, theta, rho)
```

#### **Arguments**

n	the number of observations

the the regressor coefficient of the predictive regression
theta the autocorrelation coefficient of the predictor
rho the contemporaneous correlation coefficient

#### References

Campbell B, Dufour J (1995). "Exact nonparametric orthogonality and random walk tests." *The Review of Economics and Statistics*, **77**(1), 1–16.

#### **Examples**

```
CauchyDGP(n=50, beta=0.5, theta=0.999, rho=0.9)
```

ExpVarDGP

Normal errors with exponential variance

#### Description

The processes y and x are generated by a predictive regression of the form  $y_t = \beta + x_{t-1} + \varepsilon_t$  for  $t = 1, \cdots, T$ , in which the regressors follow an AR(1) process - i.e.  $x_t = \theta x_{t-1} + u_t$ . The predictor's errors are distributed according to  $u_t \sim N(0,1)$ , whereas the disturbances of the predictive regression,  $\varepsilon_t$ , are distributed  $\varepsilon_t \sim N(0,\sigma_t^2)$ , where  $\sigma_t = \exp(0.5t)$ . Examples of DGPs with Normal disturbances and exponential variance can be found in Dufour and Taamouti (2010) and Coudin and Dufour (2009). The initial value of the process x is generated by  $x_0 = \frac{w_0}{\sqrt{1-\theta^2}}$ , where  $w_t \sim N(0,1)$ . Finally, the contemporaneous correlation between the disturbances  $\varepsilon_t$  and  $u_t$  is captured by  $\rho \varepsilon_t + w_t \sqrt{1-\rho^2}$ .

#### Usage

```

```
ExpVarDGP(n=50, beta=0.5, theta=0.999, rho=0.9)
```

GarchDGP

Normal errors with stationary GARCH(1,1) variance

#### **Description**

The processes y and x are generated by a predictive regression of the form  $y_t = \beta + x_{t-1} + \varepsilon_t$  for  $t = 1, \cdots, T$ , in which the regressors follow an AR(1) process - i.e.  $x_t = \theta x_{t-1} + u_t$ . The predictor's errors are distributed according to  $u_t \sim N(0,1)$ , whereas the disturbances of the predictive regression,  $\varepsilon_t$ , are distributed  $\varepsilon_t \sim N(0,\sigma_t^2)$ , where  $\sigma_t^2 = 0.00037 + 0.0888\varepsilon_{t-1}^2 + 0.9024\sigma_{t-1}^2$ . Examples of DGPs with Normal disturbances and stationary GARCH(1,1) variance can be found in Dufour and Taamouti (2010) and Coudin and Dufour (2009). The initial value of the process x is generated by  $x_0 = \frac{w_0}{\sqrt{1-\theta^2}}$ , where  $w_t \sim N(0,1)$ . Finally, the contemporaneous correlation between the disturbances  $\varepsilon_t$  and  $u_t$  is captured by  $\rho \varepsilon_t + w_t \sqrt{1-\rho^2}$ .

#### Usage

```
GarchDGP(n, beta, theta, rho)
```

#### Arguments

n the number of observations
beta the regressor coefficient of the predictive regression
theta the autocorrelation coefficient of the predictor

rho the contemporaneous correlation coefficient

MixtureDGP 5

#### **Examples**

```
GarchDGP(n=50, beta=0.5, theta=0.999, rho=0.9)
```

MixtureDGP

Mixture of Cauchy and Normal errors

#### **Description**

The processes y and x are generated by a predictive regression of the form  $y_t = \beta + x_{t-1} + \varepsilon_t$  for  $t = 1, \cdots, T$ , in which the regressors follow an AR(1) process - i.e.  $x_t = \theta x_{t-1} + u_t$ . The predictor's errors are distributed according to  $u_t \sim N(0,1)$ , whereas the disturbances of the predictive regression,  $\varepsilon_t$ , are distributed  $\varepsilon_t \sim s_t |\varepsilon_t^C| - (1-s_t)|\varepsilon_t^N|$ , where  $P(s_t = 0) = P(s_t = 1) = 0.5$  for all t. An example of a DGP with mixture perturbations can be found in Dufour and Taamouti (2010). The initial value of the process x is generated by  $x_0 = \frac{w_0}{\sqrt{1-\theta^2}}$ , where  $w_t \sim N(0,1)$ . Finally, the contemporaneous correlation between the disturbances  $\varepsilon_t$  and  $u_t$  is captured by  $\rho\varepsilon_t + w_t\sqrt{1-\rho^2}$ .

#### Usage

```
MixtureDGP(n, beta, theta, rho)
```

#### **Arguments**

n	the number of observations
beta	the regressor coefficient of the predictive regression
theta	the autocorrelation coefficient of the predictor
rho	the contemporaneous correlation coefficient

#### **Examples**

```
MixtureDGP(n=50, beta=0.5, theta=0.999, rho=0.9)
```

6 StudentDGP

NormalDGP

Standard normal errors

#### **Description**

The processes y and x are generated by a predictive regression of the form  $y_t = \beta + x_{t-1} + \varepsilon_t$  for  $t = 1, \cdots, T$ , in which the regressors follow an AR(1) process - i.e.  $x_t = \theta x_{t-1} + u_t$ . The predictor's errors are distributed according to  $u_t \sim N(0,1)$ , whereas the disturbances of the predictive regression,  $\varepsilon_t$ , are distributed  $\varepsilon_t \sim N(0,1)$ . The initial value of the process x is generated by  $x_0 = \frac{w_0}{\sqrt{1-\theta^2}}$ , where  $w_t \sim N(0,1)$ . Finally, the contemporaneous correlation between the disturbances  $\varepsilon_t$  and  $u_t$  is captured by  $u_t = \rho \varepsilon_t + w_t \sqrt{1-\rho^2}$ .

#### Usage

```
NormalDGP(n, beta, theta, rho)
```

#### **Arguments**

n	the number of observations
beta	the regressor coefficient of the predictive regression
theta	the autocorrelation coefficient of the predictor
rho	the contemporaneous correlation coefficient

#### References

NormalDGP(n=50, beta=0.5, theta=0.999, rho=0.9)
```

 ${\tt StudentDGP}$ 

Student's t(2) errors

#### Description

The processes y and x are generated by a predictive regression of the form  $y_t = \beta + x_{t-1} + \varepsilon_t$  for  $t = 1, \cdots, T$ , in which the regressors follow an AR(1) process - i.e.  $x_t = \theta x_{t-1} + u_t$ . The predictor's errors are distributed according to  $u_t \sim N(0,1)$ , whereas the disturbances of the predictive regression,  $\varepsilon_t$ , are distributed  $\varepsilon_t \sim t(2)$ . An example of a predictive regression DGP with t(3) perturbations can be found in Campbell and Dufour (1995). Outside a predictive regression framework, t(2) disturbances have further been considered in Dufour and Taamouti (2010). The initial value of the process x is generated by  $x_0 = \frac{w_0}{\sqrt{1-\theta^2}}$ , where  $w_t \sim N(0,1)$ . Finally, the contemporaneous correlation between the disturbances  $\varepsilon_t$  and  $u_t$  is captured by  $\rho \varepsilon_t + w_t \sqrt{1-\rho^2}$ .

StudentDGP 7

#### Usage

```
StudentDGP(n, beta, theta, rho)
```

#### **Arguments**

n the number of observations

the the regressor coefficient of the predictive regression
theta the autocorrelation coefficient of the predictor
rho the contemporaneous correlation coefficient
